## Online Appendix (not for publication)

## Appendix A: Experimental Instructions (Donation without Priors experiment)

## General Information

Thank you for participating in this experiment. This is a study of individual decision making. You will receive compensation for your participation, which will be paid to you in cash at the end of the experiment. How your compensation will be determined is explained below. In addition to this amount, you will be paid $\$ 10$ for completing an exit survey.

The instructions we have distributed to you are for your private information. The experimenter will read the instructions aloud and you should follow along on your own copy. If there is something you do not understand or you have any questions, please raise your hand.

All decisions will be made anonymously. At the end of the session, your payment will be placed in an envelope marked with your experiment ID number. Everyone will pick up his/her own payment envelope privately according to the experiment ID number. No one including the experimenter will know your decisions.

## Instructions

In this task, each person will be matched with a recipient who is currently unemployed and in need of financial help. The needy recipient is a disadvantaged person living in Melbourne and is a client of the Salvation Army's Melbourne 614 Project.

The Melbourne 614 Project assists disadvantaged people in Melbourne by directly supplying them with meals, clothing, food and anything else they might need. The Melbourne 614 Project also has an onsite nonprofit marketplace with a wide selection of food and daily necessities. The 614 Project works with people who are unemployed, homeless, or suffering from mental health issues, as well as people suffering from social poverty. The Melbourne 614 Project has agreed to pass on your donation directly to the disadvantaged person that you will be matched with (see attached letter from the Salvation Army).

You will be asked to specify your donation amount to each of 27 types of recipients who might be randomly matched with you. For each of the 27 donation decisions, you are given $\$ 20$ as an endowment. Your donation amount to each type of recipient can be any number between $\$ 0$ and $\$ 20$.

One of these recipient types will be randomly selected at the end of the experiment to be matched with you and will receive your donation in the form of cash. However, as each one is likely to be your actual matched recipient type and your donation decision will be
implemented, we ask you to make each of your donation decisions as if that were the actual recipient of your donation.

All of the recipient types are unemployed. The types may differ by the following characteristics:

1) The recipient is an alcoholic (Person who is addicted to intoxicating drinks/person who has alcohol dependence/suffers from alcoholism);
2) The recipient is attending courses to improve skills so as to enhance employment opportunities, and/or
3) The recipient is disabled (Person who has a physical or mental handicap).

For each possible recipient, we will provide information for none, some, or all of the characteristics (i.e., you will see "N/A," "Yes," or "No" for the characteristics).

For example, you might be provided the following information for a recipient. Then you will be asked your donation amount.

| Alcoholic | Attending courses to improve employment opportunities | Disability |
| :--- | :--- | :--- |
| N/A | Yes | No |

How much do you wish to donate to the recipient?
From the provided information you know the recipient is not disabled (physically or mentally) and is taking courses to improve his/her employment opportunities. You do not know if he/she is addicted to intoxicating drinks, has alcohol dependence, or suffers from alcoholism.

At the end of the session, we will select for you one recipient type at random from the 27. Your donation decision for this randomly selected recipient type will be implemented as follows.

Your donation will go to a recipient with the characteristics of this recipient type. Specifically, we will deliver your donation amount in cash, via the Salvation Army's Melbourne 614 Project, to a recipient matching the type randomly selected. If the selected recipient has no revealed characteristics, the Salvation Army will select a recipient at random.

For your donation decision, any amount out of the $\$ 20$ endowment that you do not donate to the recipient will be paid to you in cash at the end of the experiment.

For example, if you donate all $\$ 20$ in the decision, you do not have any additional cash payment to collect except the $\$ 10$ payment for completing the exit survey. If you donate $\$ 0$ in the decision, you will be paid $\$ 20$ plus the $\$ 10$ payment for completing the exit survey. If you donate $\$ \mathrm{X}$ in the decision, your cash payment will be $\$ 20-\$ \mathrm{X}$ plus the $\$ 10$ payment for completing the exit survey.

Note: Each participant's donation, if any, will go to a different recipient. No actual recipient will receive a donation from more than one participant in today's session.

## Appendix B: Predictions of the Rational Model

Proposition 1. $g_{1}^{*} \geq g_{\varnothing}^{*} \geq g_{0}^{*}$ and $\frac{\partial}{\partial p} g_{\varnothing}^{*}>0$, with

$$
\begin{equation*}
\lim _{p \rightarrow 0} g_{\emptyset}^{*}=g_{B}^{*} \text { and } \lim _{p \rightarrow 1} g_{\emptyset}^{*}=g_{G}^{*} \tag{2}
\end{equation*}
$$

Proof. We show $g_{1}^{*}>g_{\emptyset}^{*}>g_{0}^{*}$ when $g_{0}^{*}, g_{1}^{*}$ are interior (ie. $0<g_{0}^{*}<g_{1}^{*}<w$ ); the result holds when either $g_{B}^{*}=0$ or $g_{G}^{*}=w$ by continuity. First order conditions for interior $g_{G}^{*}, g_{B}^{*}$, and $g_{\emptyset}^{*}$ in $(0, w)$ are:

$$
\begin{gathered}
g_{B}^{*}: G_{0}^{\prime}\left(g_{1}^{*}\right)=V^{\prime}\left(w-g_{0}^{*}\right) \\
g_{\square}^{*}: G_{1}^{\prime}\left(g_{1}^{*}\right)=V^{\prime}\left(w-g_{1}^{*}\right) \\
g_{\varnothing}^{*}: p G_{1}^{\prime}\left(g_{\varnothing}^{*}\right)+(1-p) G_{0}^{\prime}\left(g_{\varnothing}^{*}\right)=V^{\prime}\left(w-g_{\varnothing}^{*}\right)
\end{gathered}
$$

By continuity in $p, g_{\phi}^{*}(p) \rightarrow g_{B}^{*}$ as $p \rightarrow 0$ and $g_{\varnothing}^{*}(p) \rightarrow g_{G}^{*}$ as $p \rightarrow 1$. It remains to show that $\frac{\partial}{\partial p} g_{\varnothing}^{*}>0$. The Implicit Function Theorem gives:

$$
\begin{aligned}
\frac{\partial}{\partial p} g_{\emptyset}^{*} & =-\frac{\frac{\partial}{\partial p}\left(p G_{1}^{\prime}(g)+(1-p) G_{0}^{\prime}(g)-V^{\prime}(w-g)\right)}{\frac{\partial}{\partial g}\left(G_{0}^{\prime}(g)+(1-p) G_{1}^{\prime}(g)-V^{\prime}(w-g)\right)} \\
& =-\frac{G_{1}^{\prime}(g)-G_{0}^{\prime}(g)}{G_{0}^{\prime \prime}(g)+(1-p) G_{1}^{\prime \prime}(g)+V^{\prime \prime}(w-g)}
\end{aligned}
$$

$G_{0}^{\prime \prime}(g)+(1-p) G_{1}^{\prime \prime}(g)+V^{\prime \prime}(w-g)<0$ by concavity, and $G_{1}^{\prime}(g)>G_{0}{ }^{\prime}(g)$ by increasing differences, that is, for all $g>g^{\prime}$ :

$$
\begin{gathered}
G_{1}(g)-G_{1}\left(g^{\prime}\right)>G_{0}(g)-G_{0}\left(g^{\prime}\right) \\
\Leftrightarrow \frac{G_{1}(g)-G_{1}\left(g^{\prime}\right)}{g-g^{\prime}}>\frac{G_{0}(g)-G_{0}\left(g^{\prime}\right)}{g-g^{\prime}} \\
\Leftrightarrow G_{1}^{\prime}(g)>G_{0}^{\prime}(g) \text { for } g \geq 0
\end{gathered}
$$

the final equivalence holding by sending $g^{\prime} \rightarrow g$ and by differentiability of $G$.

Proposition 2. Assume that $V(x)=\alpha_{V} x-\beta_{V} x^{2}, G_{N}(g)=\alpha_{G, N} g-\beta_{G, N} g^{2}$. Then if $\beta_{G, 1}=$ $\beta_{G, 0}$ :
(a) $p^{\dagger}=1 / 2$
(b) $\frac{d p^{\dagger}}{d \beta_{G, 1}}<0$,
(c) $\frac{d p^{\dagger}}{d \beta_{G, 0}}>0$.

Proof. From the first-order conditions (see Proof of Proposition 1):

$$
\begin{gathered}
g_{\mathrm{G}}^{*}=\min \left\{\max \left\{\frac{\alpha_{G, 1}-\alpha_{V}+2 \beta_{V} w}{2\left(\beta_{G, 1}+\beta_{V}\right)}, 0\right\}, w\right\} \\
g_{\mathrm{B}}^{*}=\min \left\{\max \left\{\frac{\alpha_{G, 0}-\alpha_{V}+2 \beta_{V} w}{2\left(\beta_{G, 0}+\beta_{V}\right)}, 0\right\}, w\right\} \\
g_{\emptyset}^{*}=\min \left\{\max \left\{\frac{\alpha_{G, 1} p+\alpha_{G, 0}(1-p)-\alpha_{V}+2 \beta_{V} w}{2\left(\beta_{G, 1} p+\beta_{G, 0}(1-p)+\beta_{V}\right)}, 0\right\}, w\right\}
\end{gathered}
$$

For $g_{\mathrm{G}}^{*}$ and $g_{\mathrm{B}}^{*}$ to be interior (and thus $g_{\varnothing}^{*} \in(0, w)$ ) we have:

$$
\begin{aligned}
& \text { (A) } \beta_{V} w<\frac{\alpha_{V}-\alpha_{G, 1}}{2}+\beta_{G, 1}+\beta_{V} \text { and (B) } \beta_{V} w>\frac{\alpha_{V}-\alpha_{G, 0}}{2} \\
\Leftrightarrow & (A) \frac{\alpha_{G, 1}-\alpha_{V}}{2}+\beta_{V} w<\beta_{G, 1}+\beta_{V} \text { and (B) } \alpha_{V}-\alpha_{G, 0}<2 \beta_{V} w .
\end{aligned}
$$

The condition $g_{G}^{*}-g_{\varnothing}^{*}\left(p^{\dagger}\right)=g_{\varnothing}^{*}\left(p^{\dagger}\right)-g_{B}^{*}$ defining $p^{\dagger}$ is then:

$$
\begin{aligned}
& \left.\frac{p^{\dagger} \alpha_{G, 1}+\left(1-p^{\dagger}\right) \alpha_{G, 0}-\alpha_{V}+2 \beta_{V} w}{\left(p^{\dagger} \beta_{G, 1}+\right.}\left(1-p^{\dagger}\right) \beta_{G, 0}+\beta_{V}\right)
\end{aligned}=\frac{1}{2}\left(\frac{\alpha_{G, 1}-\alpha_{V}+2 \beta_{V} w}{\left(\beta_{G, 1}+\beta_{V}\right)}+\frac{\alpha_{G, 0}-\alpha_{V}+2 \beta_{V} w}{\left(\beta_{G, 0}+\beta_{V}\right)}\right)
$$

Solving for $p^{\dagger}$ :

$$
\begin{gathered}
p^{\dagger} \alpha_{G, 1}+\left(1-p^{\dagger}\right) \alpha_{G, 0}-\alpha_{V}+2 \beta_{V} w=\bar{g}_{\text {news }}\left(p^{\dagger} \beta_{G, 1}+\left(1-p^{\dagger}\right) \beta_{G, 0}+\beta_{V}\right) \\
p^{\dagger}=\frac{\alpha_{V}-\alpha_{G, 0}-2 \beta_{V} w+\bar{g}_{\text {news }}\left(\beta_{G, 0}+\beta_{V}\right)}{\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{\text {news }}\left(\beta_{G, 1}-\beta_{G, 0}\right)}
\end{gathered}
$$

When $\beta_{G, 1}=\beta_{G, 0}$ this reduces to $p^{\dagger}=\frac{1}{2}$.
It remains for us to $\operatorname{sign} \frac{d p^{\dagger}}{d \beta_{G, N}}$ for $N=0,1$. We can write $\frac{d p^{\dagger}}{d \beta_{G, N}}=\frac{\partial p^{\dagger}}{\partial \bar{g}_{\text {news }}} \frac{\partial \bar{g}_{\text {news }}}{\partial \beta_{G, N}}+\frac{\partial p^{\dagger}}{\partial \beta_{G, N}}$.

$$
\begin{aligned}
& \frac{\partial p^{+}}{\partial \bar{g}_{\text {news }}}=\frac{\binom{\left(\beta_{G, 0}+\beta_{V}\right)\left(\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{\text {news }}\left(\beta_{G, 1}-\beta_{G, 0}\right)\right)}{+\left(\beta_{G, 1}-\beta_{G, 0}\right)\left(\alpha_{V}-\alpha_{G, 0}-2 \beta_{V} w+\bar{g}_{\text {news }}\left(\beta_{G, 0}+\beta_{V}\right)\right)}}{\left(\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{\text {news }}\left(\beta_{G, 1}-\beta_{G, 0}\right)\right)^{2}} \\
& =\frac{\left(\alpha_{G, 1}-\alpha_{G, 0}\right)\left(\beta_{V}+\beta_{G, 0}\right)-\left(\beta_{G, 1}-\beta_{G, 0}\right)\left(2 \beta_{V} w-\left(\alpha_{V}-\alpha_{G, 0}\right)\right)}{\left(\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{\text {news }}\left(\beta_{G, 1}-\beta_{G, 0}\right)\right)^{2}}
\end{aligned}
$$

At $\beta_{G, 1}=\beta_{G, 0}$ this reduces to $\frac{\partial p^{\dagger}}{\partial \bar{g}_{\text {news }}}=\frac{\beta_{V}+\beta_{G, 0}}{\alpha_{G, 1}-\alpha_{G, 0}}>0$.

$$
\begin{gathered}
\frac{\partial \bar{g}_{N}}{\partial \beta_{G, N}}=-\frac{1}{2} \frac{2 \beta_{V} w-\left(\alpha_{V}-\alpha_{G, n}\right)}{\left(\beta_{G, N}+\beta_{V}\right)^{2}} \\
\frac{\partial p^{\dagger}}{\partial \beta_{G, 1}}=\bar{g}_{N} \frac{\alpha_{V}-\alpha_{G, 0}-2 \beta_{V} w+\bar{g}_{n e w s}\left(\beta_{G, 0}+\beta_{V}\right)}{\left(\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{N}\left(\beta_{G, 1}-\beta_{G, 0}\right)\right)^{2}}>0
\end{gathered}
$$

At $\beta_{G, 1}=\beta_{G, 0}$ this reduces to $\frac{\partial p^{\dagger}}{\partial \beta_{G, 1}}=\frac{\bar{g}_{\text {news }}}{2\left(\alpha_{G, 1}-\alpha_{G, 0}\right)}>0$.
$\frac{\partial p^{\dagger}}{\partial \beta_{G, 0}}$

$$
\begin{gathered}
=\frac{\bar{g}_{\text {news }}\left(\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{\text {news }}\left(\beta_{G, 1}-\beta_{G, 0}\right)\right)-\bar{g}_{\text {news }}\left(\alpha_{V}-\alpha_{G, 0}-2 \beta_{V} w+\bar{g}_{\text {news }}\left(\beta_{G, 0}+\beta_{V}\right)\right)}{\left(\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{\text {news }}\left(\beta_{G, 1}-\beta_{G, 0}\right)\right)^{2}} \\
=\bar{g}_{\text {news }} \frac{\alpha_{G, 1}-\alpha_{V}-\bar{g}_{\text {news }}\left(\beta_{G, 1}+\beta_{V}\right)+2 \beta_{V} w}{\left(\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{\text {news }}\left(\beta_{G, 1}-\beta_{G, 0}\right)\right)^{2}} \\
=\bar{g}_{N} \frac{\frac{1}{2}\left(\alpha_{G, 1}-\alpha_{V}+2 \beta_{V} w\right)-\frac{1}{2} \frac{\left(\beta_{G, 1}+\beta_{V}\right)}{\left(\beta_{G, 0}+\beta_{V}\right)}\left(\alpha_{G, 0}-\alpha_{V}+2 \beta_{V} w\right)}{\left(\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{\text {news }}\left(\beta_{G, 1}-\beta_{G, 0}\right)\right)^{2}} \\
=\bar{g}_{\text {news }} \frac{\frac{1}{2}\left(2 \beta_{V} w-\left(\alpha_{V}-\alpha_{G, 0}\right)\right)\left(1-\frac{1}{2}\left(\frac{\beta_{G, 1}+\beta_{V}}{\beta_{G, 0}+\beta_{V}}\right)\right)}{\left(\alpha_{G, 1}-\alpha_{G, 0}-\bar{g}_{\text {news }}\left(\beta_{G, 1}-\beta_{G, 0}\right)\right)^{2}}
\end{gathered}
$$

At $\beta_{G, 1}=\beta_{G, 0}$ this reduces to $\frac{\partial p^{\dagger}}{\partial \beta_{G, 0}}=\bar{g}_{\text {news }} \frac{1}{2} \frac{2 \beta_{V} w-\left(\alpha_{V}-\alpha_{G, 0}\right)}{\left(\alpha_{G, 1}-\alpha_{G, 0}\right)^{2}}$, and thus $\frac{\partial p^{\dagger}}{\partial \beta_{G, 0}}>0$ when $2 \beta_{V} w>$ $\alpha_{V}-\alpha_{G, 0}$ which holds under condition ( $B$ ).

For $n=1$ at $\beta_{G, 1}=\beta_{G, 0}$,

$$
\begin{gathered}
\frac{d p^{\dagger}}{d \beta_{G, 1}}=-\frac{1}{2} \frac{\beta_{V}+\beta_{G, 0}}{\alpha_{G, 1}-\alpha_{G, 0}} \frac{2 \beta_{V} w-\left(\alpha_{V}-\alpha_{G, 1}\right)}{\left(\beta_{G, 1}+\beta_{V}\right)^{2}}+\frac{\bar{g}_{\text {news }}}{2\left(\alpha_{G, 1}-\alpha_{G, 0}\right)} \\
=-\frac{1}{2} \frac{2 \beta_{V} w-\left(\alpha_{V}-\alpha_{G, 1}\right)}{\left(\alpha_{G, 1}-\alpha_{G, 0}\right)\left(\beta_{G, 1}+\beta_{V}\right)}+\frac{\bar{g}_{\text {news }}}{2\left(\alpha_{G, 1}-\alpha_{G, 0}\right)}=-\frac{1}{4\left(\beta_{G, 1}+\beta_{V}\right)}<0
\end{gathered}
$$

For $n=0$ at $\beta_{G, 1}=\beta_{G, 0}$ we have:

$$
\frac{d p^{\dagger}}{d \beta_{G, 0}}=-\frac{1}{2} \frac{\beta_{V}+\beta_{G, 0}}{\alpha_{G, 1}-\alpha_{G, 0}} \frac{2 \beta_{V} w-\left(\alpha_{V}-\alpha_{G, 1}\right)}{\left(\beta_{G, 0}+\beta_{V}\right)^{2}}+\bar{g}_{\text {news }} \frac{1}{2} \frac{2 \beta_{V} w-\left(\alpha_{V}-\alpha_{G, 0}\right)}{\left(\alpha_{G, 1}-\alpha_{G, 0}\right)^{2}}
$$

$$
=\frac{1}{2} \frac{\left(2 \beta_{V} w-\left(\alpha_{V}-\alpha_{G, 1}\right)\right)^{2}}{\left(\alpha_{G, 1}-\alpha_{G, 0}\right)^{2}\left(\beta_{G, 0}+\beta_{V}\right)}>0
$$

Proof of Corollary 1. Consider positive affiliation at $\mathrm{p}=1 / 2$; the proof for negative affiliation is analogous. Thus, $p g_{G}^{*}+(1-p) g_{B}^{*}>g_{\varnothing}^{*}(p)$ at $p=1 / 2$. By rearranging the inequality:

$$
\frac{1}{2} g_{G}^{*}+\frac{1}{2} g_{B}^{*}>g_{\varnothing}^{*}(p) \Leftrightarrow g_{G}^{*}-g_{\emptyset}^{*}(p)>g_{\varnothing}^{*}(p)-g_{B}^{*}
$$

giving the condition for Persuadable Altruism.

Proof of Corollary 2. If $g_{\emptyset}^{*}(p)$ is regular, then positive affiliation at $p=1 / 2$ is equivalent to positive affiliation for a range of $p \in\left[0, p^{\dagger}\right)$ in which $p^{\dagger}>1 / 2$. Moreover, $g_{\varnothing}^{*}(p)$ must lie below the line connecting $\left(0, g_{B}^{*}\right)$ and $\left(1, g_{G}^{*}\right)$ for all $p \in(0,1)$, which implies that $p g_{G}^{*}+$ $(1-p) g_{B}^{*}>g_{\varnothing}^{*}(p)$ for all $p \in(0,1)$.

## Appendix C: Additional Tables

Table C1: The strength of information effect: $p$-values with multiple hypothesis testing adjustment (when two characteristics are NAs, Donation with Priors)

|  | Difference | Multiple hypothesis testing adjustment |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  |  | Unadjusted <br> p-values | Bonferroni <br> p-values | Holm <br> p-values | List et al. (2019) <br> p-values |
| A+ vs. NA | 0.603 | 0.017 | 0.156 | 0.087 | 0.070 |
| A- vs. NA | -0.103 | 0.769 | 1.000 | 1.000 | 0.938 |
| A+ vs. A- | 0.706 | 0.084 | 0.759 | 0.337 | 0.237 |
| C+ vs. NA | 2.265 | 0.000 | 0.003 | 0.002 | 0.000 |
| C- vs. NA | 0.309 | 0.108 | 0.975 | 0.325 | 0.255 |
| C+ vs. C- | 1.956 | 0.000 | 0.003 | 0.003 | 0.000 |
| D+ vs. NA | 3.221 | 0.000 | 0.003 | 0.003 | 0.000 |
| D- vs. NA | -0.044 | 0.818 | 1.000 | 0.818 | 0.818 |
| D+ vs. D- | 3.265 | 0.000 | 0.003 | 0.002 | 0.000 |

Note: List et al. (2019) p-values are produced using Stata command "mhtreg", which allows the testing procedure to be used in multivariate regressions (Steinmayr 2020). The underlying regressions are estimated using OLS with standard errors clustered at the subject level, in which "Difference" refers to the coefficient estimate of each comparison.

Figure C1: Scatter plot of giving under information vs. under no information

Note: This figure corresponds to Table4 in the main text. The four panels correspond to the four rows in the table. Each dot in a panel represents a subject's giving under information versus giving under no information (how giving is calculated is explained in the main text). Each panel presents a scatter plot given a characteristic (Alcohol, Courses or Disabled) or averaged across all three characteristics (ALL).

Figure C2: Donations when two characteristics are NAs under different priors (Donation with Priors experiment)
prior >= 80\%

Courses

Disabled

$60 \%$ < prior < 80\%

Alcohol

Courses

40\% <= prior < 60\%
Alcohol

Disabled

$20 \%$ < prior < $40 \%$

## Appendix D. Survey Experiment

## D1. Instructions

## General Information

Welcome to the online experiment. To ensure the quality of our scientific research, please now sit in a quiet place with a PC without distractions and put away your phone. You should complete all tasks individually and do not engage in any other activities during the experiment.

Your task is to answer a few survey questions regarding the donation recipients of Salvation Army's Melbourne 614 Project. You will receive $\$ 10$ for completing this experiment.

How do you get paid? Since we can no longer pay you in cash, we will require you to create a PayID before registering for an online experiment. You can create a PayID via your regular mobile banking app or internet banking. It takes less than two minutes. At the end of the experiment, you will be asked to provide either the email address or phone number you used to register for PayID. If you haven't created a PayID (https://payid.com.au), please do it now before proceeding.

For more information about this study, please refer to the explanatory statement here.

## Background Information

The Melbourne 614 Project assists disadvantaged people in Melbourne by directly supplying them with meals, clothing, food, and anything else they might need. The Project works with people who are homeless, those suffering from mental health issues, as well as people suffering from social poverty.

All donation recipients are unemployed. They often present with one or more of the following characteristics:

Alcoholism: addiction to intoxicating drinks.
Attending courses: to improve skills so as to enable employment opportunities.
Disability: physical or mental handicap
Each of these characteristics can be caused by random luck, own effort, own choice, or other factors.

Please indicate below your opinion on the extent to which each possible cause contributes to each of the characteristics (in \%). The percentage each cause contributes can be any number from 0 to 100 . The numbers you enter for each characteristic must add up to 100.

## 1. Alcoholism

If you think there are other factors causing alcoholism, please explain below.
2. Attending courses

If you think there are other factors causing recipients to attend courses, please explain below.
3. Disability

|  | 0 | 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

If you think there are other factors causing disability, please explain below.

## D2. Data Analysis

In total, 60 participants completed the survey experiment. Table D1 shows the average and median of the percentage of each cause contributing to each characteristic. Participants stated that random luck contributes most to disability, own effort contributes most to recipients' attending courses, and own choice contributes most to alcoholism.

Table D1: Percentage of each cause contributing to each characteristic (average*/median)

|  | Alcoholism | Attending Courses | Disability |
| :--- | :---: | :---: | :---: |
| Random luck | $11.3 / 10$ | $9.9 / 5$ | $64.6 / 62$ |
| Own effort | $21.5 / 20$ | $43.7 / 41$ | $8.8 / 2$ |
| Own choice | $43.2 / 40$ | $36.8 / 35$ | $6.6 / 0$ |
| Other factors | $24.0 / 15$ | $9.7 / 5$ | $20.1 / 10$ |

[^0]
[^0]:    *Averages must sum to 100 .
